

MAC Address

Your task is to insert the missing parts of the code in the function **checkMAC**. This function takes in input a string **mac** and check if it is a MAC address.

A MAC address is composed by:

- 6 hexadecimal couples
- Each couple is separated by the symbol ' : '

An example is:

30:33:A4:F2:55:12

Input

The first line of input contains a string **mac**

Output

The output displays **True** if the string mac is a MAC address, **False** otherwise.

Sample input

Sample output

30:33:A4:F2:55:12:12	False
30:33:A4:F2:55:1D	True
30:33:A4:F2:55::12	False
